

Task -5: Implement various searching and sorting operations in python programming.

Aim: To implement various searching and sorting operations in python programming.

Algorithm:

1. Input Definition:
2. Define the function find_employee_by_id that takes two parameters:
3. Iterate through the list
4. Use a loop to iterate through each dictionary in employee list.
5. Return matching found, return the current dictionary.
6. Handle No match.
If the loop completes without finding match, return None.

Program S.1

```
def find_employee_by_id(employees, target_id):  
    for employee in employees:  
        if employee['id'] == target_id:  
            return employee.  
    return None
```

Test function

```
employee = [  
    {'id': 1, 'name': 'Alice', 'department': 'HR'},  
    {'id': 2, 'name': 'Bob', 'department': 'Engineering'},  
    {'id': 3, 'name': 'Charlie', 'department': 'Sales'}  
]
```

```
print(find_employee_by_id(employees, 2))
```

output: {'id': 2, 'name': 'Bob', 'department': 'Engineering'}

output:

{ 'id': 2, 'name': 'Bob', 'department': 'Engineering' }

SI (%)	

Ques 1/1) Find the necessary data to develop a graph and
and various charts. Also find the trend in
of the background and from country.

output 1.

Before sorting:

```
{ 'name': 'Alice', 'score': 88 }
```

```
{ 'name': 'Bob', 'score': 95 }
```

```
{ 'name': 'Charlie', 'score': 75 }
```

```
{ 'name': 'Diana', 'score': 85 }
```

After sorting:

```
{ 'name': 'Charlie', 'score': 75 }
```

```
{ 'name': 'Diana', 'score': 85 }
```

```
{ 'name': 'Alice', 'score': 88 }
```

```
{ 'name': 'Bob', 'score': 95 }
```

11/9/65 5.2 :- Algorithm

Ques To implement a feature that sorts the student records by their Scores using the Bubble Sort Algorithm.

Algorithm:

1. Initialization:
 - Get the length of students and store it in.
2. Outer loop:
 - Iterate from $i=0$ to $n-1$. This loop represents the number of passes through the list.
3. Track swaps:
 - Initialize boolean variable swapped to false, this variable will track if any swaps are made in current pass.
4. Inner loop:
 - Iterate from $j=0$ to $n-i-2$ (inclusive). This loop compares adjacent elements in list and performs swaps if necessary.
5. Early Termination:
 - After each pass of inner loop, check if swapped is false. If no swaps were during pass, the list is already sorted and you can break.
6. Completion:
 - The function modifies the students list in place, sorting it by score.

Program:

```
def bubble_sort_scores(students):
```

```
    n = len(students)
```

```
    for i in range(n):
```

```
        # Track if any swap is made in this pass
```

```
        swapped = False
```

```
        for j in range(0, n-i-1):
```

```
            if students[j]['score'] > students[j+1]['score']:
```

```
                # Swap if score of current student is greater than next student [j], student[j+1] = student[j+1], student[j]
```

swapped = True.

if no two elements were swapped, the list is already sorted.

if not swapped:

break

Example usage.

```
students = [  
    {'name': 'Alice', 'score': 88},  
    {'name': 'Bob', 'score': 95},  
    {'name': 'Charlie', 'score': 75},  
    {'name': 'Diane', 'score': 85},  
]
```

print("Before sorting.")

for student in students:

print(student)

bubble_sort_scores(students)

print("After sorting.")

for student in students:

print(student)

Result: Thus, the program for various searching and sorting operation is executed and verified successfully.
